

FA220 Series

Safety Products and Limiters

Our sash control devices come in three varieties: limit devices, friction adjustors, and support arms. Limit devices restrict the opening on projected or casement windows - a variety of track and arm lengths are available. Friction adjustors are used to add friction to hinges on projected windows. For top hung windows, support arms are available in two models. The first opens to full extension and automatically locks into place. The second, designed to extend only 1.5", opens fully with the addition of a key. Once the key is removed, the arm automatically resets when closed

PRODUCT HIGHLIGHTS

- Friction adjustors are used either as a limit device or for additional friction in conjunction with certain types of hinging on projected windows.
- Adjusting set screw in the sliding brass shoe, a homeowner can easily adjust the tension required to open and close the window.
- Limit device hardware is designed to restrict the opening on projected or casement windows. This mechanism automatically stops the vent at a safety position as required by the user or required by law.
- For cleaning and ease of window assembly, a key may be used to release the window to its maximum opening.
